Finance operating system

CLIENT PROPOSAL

Tia ERP Proposal: Role-Based Finance Operations Platform for Modern Businesses

A comprehensive proposal for delivering a secure, multi-tenant, multi-role finance and operations platform that centralizes control, improves visibility, and strengthens audit readiness.

Prepared for: Prospective Client

Prepared by: Tia Product Team

Date: June 8, 2025

Document Type: Product and implementation proposal

Proposal Focus

This proposal presents Tia as a scalable finance operations solution for growing organizations with multiple users, branches, approval layers, and reporting needs.

It reflects the current product foundation already present in the platform and outlines the recommended path to client deployment, adoption, and expansion.

EXECUTIVE SUMMARY

Overview

Tia is a cloud-based finance operating system designed to help businesses manage core financial workflows from a single controlled workspace. The platform is built to support multiple organizations, multiple branches, and multiple user roles, making it suitable for businesses that need operational discipline as they scale.

The solution combines finance administration, operational workflows, reporting, access management, and audit visibility in one product. Rather than relying on scattered spreadsheets, disconnected tools, and manual follow-up, clients can operate through a structured platform with role-based controls and traceable activity.

What This Proposal Covers

- Business problem and opportunity
- Proposed solution and product positioning
- Functional scope and user roles
- Technical architecture and security approach
- Implementation phases and delivery model
- Expected business outcomes and next steps

6

Defined role types across platform and business operations

Multi-tenant

Business-level isolation for scalable SaaS delivery

Audit-ready

Traceable workflows, access control, and reporting structure

CLIENT NEED

Why This Solution Matters

Many growing businesses struggle to maintain control over finance processes as teams, branches, and transaction volumes increase. Approvals become inconsistent, reporting is delayed, access is loosely managed, and audit preparation becomes expensive and stressful. Tia addresses this gap by giving finance teams, management, and oversight users a shared platform with defined workflows and controlled visibility.

BUSINESS CONTEXT

Problem Statement

Common Operational Challenges

- Finance data is split across spreadsheets, chats, and disconnected tools.
- User access is often too broad or inconsistently managed.
- Managers and auditors lack a reliable view of business activity.
- Branch-level operations are difficult to compare and control.
- Manual onboarding and billing workflows create avoidable delays.

Business Impact

- Slow approvals and slow decision-making
- Reduced confidence in reports and financial visibility
- Greater risk of unauthorized changes or poor accountability
- Higher effort during audit reviews and month-end close
- Difficulty scaling finance operations across multiple teams or locations

PROPOSED RESPONSE

Tia as the Recommended Platform

Tia is proposed as a modern finance operations platform that centralizes finance workflows, controls visibility by role, supports branch-aware business operations, and provides a structured path from prospect onboarding to live subscription-managed usage. The system is not only an internal finance tool but a scalable operating platform that can support multiple client organizations under one managed service environment.

Need	Tia Response
Controlled access to finance processes	Role-based workspaces for super admin, business admin, manager, staff, auditor, and account users
Branch-aware operations	Business and branch scoping with separate operational views and data filtering
Stronger reporting and oversight	Trial balance, general ledger, reports, audit visibility, and export-ready outputs
Client onboarding and lifecycle management	Organization onboarding, demo access management, and subscription oversight

SOLUTION SCOPE

Functional Scope of the Platform

The current product structure already supports a substantial platform foundation. The following modules define the functional scope that should be presented to the client.

Module Area	Description	Business Value
Organization Management	Onboarding organizations, managing organization details, business status, branch limits, and operating profile	Supports client setup, expansion, and centralized control
User and Role Management	Assigning role-based access to finance, operations, management, and oversight users	Reduces access risk and improves accountability
Branch Management	Structuring branches, head office access, and branch-aware visibility	Enables multi-location control and clearer operational responsibility
Customers and Billing	Customer records, invoice workflows, invoice items, balances, and payment-linked operations	Improves revenue control and billing visibility
Expenses and Approvals	Expense creation, status management, approval awareness, and spend tracking	Strengthens spend governance and policy enforcement
Payroll	Compensation-related workflow support and payroll access by role	Creates structured control over payroll operations
General Ledger and Journal Posting	GL posting, chart of accounts, journal entries, and statement viewing	Supports accounting discipline and financial reporting integrity
Reports and Trial Balance	Financial reports, transaction summaries, statement exports, and trial balance views	Improves decision support and finance visibility
Asset Management	Asset-related records and role-based access to asset data	Supports broader finance operations beyond daily transactions
Audit and Traceability	Audit logs, read-only review workflows, and evidence visibility	Improves compliance readiness and accountability

Module Area	Description	Business Value
Demo and Subscription Management	Demo request approval, access-link generation, and subscription oversight	Supports the sales-to-activation lifecycle for the platform

USER MODEL

Role-Based Operating Structure

Tia is designed around a role-sensitive operating model. This is a major strength of the product and should be highlighted clearly in the proposal because it demonstrates governance, scalability, and practical usability across different business responsibilities.

Super Admin

Platform-level workspace for managing organizations, demo requests, subscriptions, and platform settings.

Business Admin

Business-level control over branches, payroll, users, and organization-wide setup.

Manager / Head of Operations

Operational oversight, reporting access, and GL-related visibility for business leaders.

Staff / Operations

Frontline operational use for day-to-day workflows under controlled access boundaries.

Auditor

Read-only visibility into reports, ledgers, and audit-related information to support oversight and review.

Account

Finance-focused role with access to payroll, trial balance, ledgers, and broader accounting workflows.

CONTROL PRINCIPLE

Why This Matters to the Client

- Each user sees the tools relevant to their job.
- Sensitive finance information can be restricted by role and branch.
- Management and auditors can review activity without changing records.

- Platform administrators can manage multiple client organizations from one system.
- The model is suitable for both internal deployment and SaaS delivery.
- The approach improves training, adoption, and accountability.

TECHNOLOGY

Technical Architecture and Security Approach

Tia is structured as a modular web application with separate presentation pages, role-aware workspaces, shared utilities, modular business features, and a Supabase-backed data layer. This architecture is appropriate for phased delivery because it allows new modules and workflows to be expanded without rebuilding the core platform.

The backend model is designed for multi-tenant usage, with organization-level data isolation and table structures that align with finance and operations workflows.

Architecture Highlights

- Frontend built with modular HTML, CSS, and JavaScript
- Supabase authentication and database integration
- Role-based routing and workspace rendering
- Row-level data isolation for business tenants
- Support for demo, trial, and live operating modes

DATA MODEL

Layer	Current Direction
Authentication	Supabase Auth with live user sessions and metadata-backed role resolution
Tenant Structure	Businesses, branches, business members, profiles, and platform admins
Operations Data	Customers, invoices, payments, expenses, suppliers, products, assets, payroll-related support
Finance Data	Chart of accounts, journal entries, ledger lines, tax rates, and reporting outputs
Oversight and Lifecycle	Subscriptions, audit logs, demo requests, and demo access links

From a client perspective, the value of this architecture is straightforward: it supports secure growth, cleaner reporting, easier maintenance, and a credible foundation for operational scale.

DELIVERY MODEL

Recommended Implementation Approach

Because the product foundation already exists, the recommended approach is not to restart from scratch but to move through a structured completion and deployment roadmap. This reduces waste, accelerates time to value, and allows the client to benefit from the existing architecture while refining the remaining business workflows.

Phase	Focus	Indicative Activities	Outcome
Phase 1	Foundation Stabilization	Validate live data connections, confirm role access, finalize organization onboarding, and harden navigation and permissions.	Stable core platform ready for controlled pilot usage.
Phase 2	Workflow Completion	Complete create and edit forms for invoices, expenses, and operational data capture. Refine approval-related workflows.	Usable end-to-end operational workflow for key finance activities.
Phase 3	Finance Depth	Enhance chart of accounts support, reporting, trial balance workflows, and accounting controls.	Stronger accounting credibility and deeper reporting value.
Phase 4	Commercial and Scale Readiness	Billing automation, subscription enforcement, support workflows, platform reporting, and client rollout processes.	Deployment-ready SaaS operating model with lifecycle management.

INDICATIVE TIMELINE

A realistic client engagement would treat implementation as a phased rollout rather than a single delivery event. Exact timing should be finalized after requirements confirmation, but the current product maturity supports a staged delivery model with early pilot visibility followed by deeper finance capability in later phases.

DELIVERABLES

Expected Client Deliverables

Platform Deliverables

- Client-ready branded web application
- Secure login and role-based workspace routing
- Organization, branch, and user administration flows
- Finance workflow modules aligned to approved scope
- Reporting and export capability for supported statements

Deployment Deliverables

- Configured Supabase project and security policies
- Database schema and access policies for live use
- Seed or onboarding logic for client activation
- Demo and trial process for evaluation and adoption
- Basic operational handover for admins and key users

ASSUMPTIONS

- This proposal assumes the client wants a finance operations platform rather than a simple brochure website.
- Commercial pricing, hosting cost, support SLA, and final implementation timeline should be finalized after scope confirmation.
- Any client-specific integrations, regulatory requirements, or custom reporting needs should be handled in the discovery and solution refinement stage.

OPTIONAL COMMERCIAL SECTION

If this document is being presented formally to a paying client, a final version can include a dedicated commercial page covering implementation cost, support model, change request handling, and post-launch maintenance options. Since no pricing direction was supplied in the source materials, this version keeps the proposal commercially neutral and scope-focused.

VALUE PROPOSITION

Expected Business Benefits

Operational Control

Centralized workflows reduce fragmented processing and create clearer ownership across finance tasks.

Visibility

Management and finance teams gain a clearer picture of transactions, branch performance, and reporting outputs.

Security

Role-based permissions and business isolation reduce access risk and improve governance.

Scalability

The product structure supports expansion across more users, more branches, and more client organizations.

Audit Readiness

Traceability, controlled visibility, and ledger-aligned reporting strengthen confidence during review cycles.

Commercial Readiness

Demo requests, onboarding, and subscription oversight create a credible path from interest to paid usage.

CONCLUSION

Recommendation

Tia should be presented to the client as a finance operations platform with a strong governance model, not simply as a dashboard application. Its current architecture already supports the core foundation required for a modern multi-tenant business finance system, and the remaining work is best positioned as phased implementation and product completion.

The platform is especially compelling for organizations that need structured access, branch-aware control, stronger reporting, and a practical path away from manual finance administration. With phased delivery and client-specific refinement, Tia can serve as a scalable operational backbone for finance teams and business leadership.

Next Step

The next recommended step is to convert this proposal into a final client issue version with client name, commercial terms, timeline commitment, and any organization-specific scope adjustments.
